Bayesian Multivariate Linear Regression

We can additionally suppose each b_{ij} independently follows

$$b_{ij} \sim \mathcal{N}(0, \tau^2),$$

then the posterior likelihood function is

$$\begin{split} & L(\mathbf{B}, \mathbf{\Sigma}) \\ &= \prod_{i=1}^{N} \frac{1}{\sqrt{(2\pi)^{p} \det(\mathbf{\Sigma})}} \exp\left(-\frac{1}{2} (\mathbf{B}^{\top} \mathbf{x}_{i} - \mathbf{y}_{i})^{\top} \mathbf{\Sigma}^{-1} (\mathbf{B}^{\top} \mathbf{x}_{i} - \mathbf{y}_{i})\right) \\ & \cdot \prod_{i=1}^{p} \prod_{j=1}^{q} \frac{1}{\sqrt{2\pi\tau^{2}}} \exp\left(-\frac{b_{ij}^{2}}{2\tau^{2}}\right) \\ & \propto & \frac{1}{(\det(\mathbf{\Sigma}))^{N/2}} \exp\left(-\frac{1}{2} \mathrm{tr}\left((\mathbf{X}\mathbf{B} - \mathbf{Y})\mathbf{\Sigma}^{-1} (\mathbf{X}\mathbf{B} - \mathbf{Y})^{\top}\right) - \frac{1}{2\tau^{2}} \left\|\mathbf{B}\right\|_{F}^{2}\right), \end{split}$$

which leads to

$$\operatorname{vec}(\hat{\mathbf{B}}) = (\mathbf{I}_q \otimes \tau^2 \mathbf{X}^\top \mathbf{X} + \mathbf{\Sigma} \otimes \mathbf{I}_p)^{-1} \operatorname{vec}(\tau^2 \mathbf{X}^\top \mathbf{Y}).$$

Bayesian Multivariate Linear Regression

We typically suppose

$$oldsymbol{eta}_{(i)} \overset{ ext{i.i.d}}{\sim} \mathcal{N}_q(\mathbf{0}, au^2 \mathbf{\Sigma}), \qquad ext{where} \qquad \mathbf{B} = egin{bmatrix} oldsymbol{eta}_{(1)}^{ op} \ dots \ oldsymbol{eta}_{(p)}^{ op} \end{bmatrix} \in \mathbb{R}^{p imes q},$$

then the posterior likelihood function is

$$\begin{split} & \mathcal{L}(\mathbf{B}, \mathbf{\Sigma}) \\ &= \prod_{i=1}^{N} \frac{1}{\sqrt{(2\pi)^{p} \det(\mathbf{\Sigma})}} \exp\left(-\frac{1}{2} (\mathbf{B}^{\top} \mathbf{x}_{i} - \mathbf{y}_{i})^{\top} \mathbf{\Sigma}^{-1} (\mathbf{B}^{\top} \mathbf{x}_{i} - \mathbf{y}_{i})\right) \\ & \cdot \prod_{j=1}^{p} \frac{1}{\sqrt{(2\pi)^{q} \det(\mathbf{\Sigma})}} \exp\left(-\frac{1}{2\tau^{2}} \boldsymbol{\beta}_{(j)}^{\top} \mathbf{\Sigma}^{-1} \boldsymbol{\beta}_{(j)}\right) \\ & \propto \frac{1}{(\det(\mathbf{\Sigma}))^{N/2}} \exp\left(-\frac{1}{2} \mathrm{tr} \left((\mathbf{X} \mathbf{B} - \mathbf{Y}) \mathbf{\Sigma}^{-1} (\mathbf{X} \mathbf{B} - \mathbf{Y})^{\top} \right) - \frac{1}{2\tau^{2}} \mathbf{B} \mathbf{\Sigma}^{-1} \mathbf{B}^{\top} \right). \end{split}$$

Bayesian Multivariate Linear Regression

We have

$$\hat{\mathbf{B}}_{\lambda} = (\mathbf{X}^{\top}\mathbf{X} + \lambda \mathbf{I})^{-1}\mathbf{X}^{\top}\mathbf{Y},$$

and

$$\hat{\mathbf{\Sigma}}_{\lambda} = \frac{1}{N} \mathbf{Y}^{\top} (\mathbf{I} - \mathbf{X} (\mathbf{X}^{\top} \mathbf{X} + \lambda \mathbf{I})^{-1} \mathbf{X}^{\top}) \mathbf{Y},$$

where $\lambda = 1/\tau^2$.

Let \mathbf{x} be a p-dimensional random vector with mean $\mathbf{0}$ and covariance matrix $\mathbf{\Sigma} \succ \mathbf{0}$.

Let $\mathbf{u}_1 \in \mathbb{R}^p$ with $\|\mathbf{u}_1\|_2 = 1$ and maximizing the variance of $\mathbf{u}_1^\top \mathbf{x}$, then

$$(\mathbf{\Sigma} - \lambda_1 \mathbf{I})\mathbf{u}_1 = \mathbf{0},$$

where λ_1 is the largest root of

$$\det(\mathbf{\Sigma} - \lambda \mathbf{I}) = 0.$$

- **1** We call $y_1 = \mathbf{u}_1^{\mathsf{T}} \mathbf{x}$ as the first principle component of \mathbf{x} .
- ② The pair $\lambda_1 \in \mathbb{R}$ and $\mathbf{u}_1 \in \mathbb{R}^p$ are the largest eigenvalue and corresponding eigenvector of Σ .

For the second principle components

$$y_2 = \mathbf{u}_2^{\mathsf{T}} \mathbf{x},$$

we determine $\mathbf{u}_2 \in \mathbb{R}^p$ by maximizing the variance of y_2 under the constraints $\|\mathbf{u}_2\|_2 = 1$ and y_2 be uncorrelated with y_1 .

For the k-th principle component

$$y_k = \mathbf{u}_k^{\mathsf{T}} \mathbf{x},$$

we determine \mathbf{u}_k by maximizing the variance of y_k under the constraints $\|\mathbf{u}_k\|_2 = 1$ and y_k be uncorrelated with y_1, \dots, y_{k-1} .

Let vector $\mathbf{u}_k \in \mathbb{R}^p$ the k-th principle component

$$y_k = \mathbf{u}_k^{\top} \mathbf{x}$$

holds that

$$(\mathbf{\Sigma} - \lambda_k \mathbf{I})\mathbf{u}_k = \mathbf{0},$$

where λ_k is the k-th largest root of

$$\det(\mathbf{\Sigma} - \lambda \mathbf{I}) = 0.$$

The pair $\lambda_k \in \mathbb{R}$ and $\mathbf{u}_k \in \mathbb{R}^p$ are the k-th largest eigenvalue and corresponding eigenvector of Σ .

Let vector $\mathbf{u}_k \in \mathbb{R}^p$ the k-th principle component

$$y_k = \mathbf{u}_k^{\top} \mathbf{x}$$

holds that

$$(\mathbf{\Sigma} - \lambda_k \mathbf{I})\mathbf{u}_k = \mathbf{0},$$

where λ_k is the k-th largest root of

$$\det(\mathbf{\Sigma} - \lambda \mathbf{I}) = 0.$$

The pair $\lambda_k \in \mathbb{R}$ and $\mathbf{u}_k \in \mathbb{R}^p$ are the k-th largest eigenvalue and corresponding eigenvector of Σ .

PCA for dimensionality Reduction

We can write

$$\mathbf{U}_k = \begin{bmatrix} \mathbf{u}_1 & \cdots & \mathbf{u}_k \end{bmatrix} \in \mathbb{R}^{p \times k} \quad \text{and} \quad \mathbf{\Lambda}_k = \begin{bmatrix} \lambda_1 & 0 & \cdots & 0 \\ 0 & \lambda_2 & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \cdots & \lambda_k \end{bmatrix} \in \mathbb{R}^{k \times k}$$

contains the top-k eigenvectors and eigenvalues pairs of Σ , that is

$$\Sigma \mathbf{U}_k = \mathbf{U}_k \mathbf{\Lambda}$$
 with $\mathbf{U}_k^{\top} \mathbf{U}_k = \mathbf{I}$.

PCA for dimensionality Reduction

We can keep $\mathbf{U}_k \in \mathbb{R}^{p \times k}$ and transform $\mathbf{x} \in \mathbb{R}^p$ to

$$\mathbf{U}_{k}^{\mathsf{T}}\mathbf{x}\in\mathbb{R}^{k}$$
,

where $k \ll p$.

The information of x can be estimated by

$$\hat{\mathbf{x}} = \mathbf{U}_k(\mathbf{U}_k^{\top}\mathbf{x}) \in \mathbb{R}^p$$
.

We have

$$\operatorname{Cov}[\hat{\mathbf{x}}] = \mathbf{U}_k \mathbf{\Lambda}_k \mathbf{U}_k^{\top},$$

which is the best rank-k approximation of Σ .

- 4 Kernel Principal Component Analysis

Sample Principal Components Analysis

Given observation $\mathbf{x}_1, \dots, \mathbf{x}_N \in \mathbb{R}^p$, we construct sample covariance

$$\mathbf{S} = rac{1}{N-1} \sum_{lpha=1}^N (\mathbf{x} - \mathbf{ar{x}}) (\mathbf{x} - \mathbf{ar{x}})^{ op}, \qquad ext{where} \ \ \mathbf{ar{x}} = rac{1}{N} \sum_{lpha=1}^N \mathbf{x}_lpha.$$

Let spectral decomposition of **S** be $\mathbf{S} = \mathbf{U} \boldsymbol{\Lambda} \mathbf{U}$, where $\mathbf{U} \in \mathbb{R}^{p \times p}$ is orthogonal and $\boldsymbol{\Lambda} \in \mathbb{R}^{p \times p}$ is diagonal.

We write

$$\mathbf{X} = \begin{bmatrix} \mathbf{x}_1^{\mathsf{T}} \\ \vdots \\ \mathbf{x}_N^{\mathsf{T}} \end{bmatrix} \in \mathbb{R}^{N \times p},$$

which results the sample principle components

$$\mathbf{Y} = \begin{bmatrix} (\mathbf{x}_1 - \bar{\mathbf{x}})^\top \mathbf{U}_k \\ \vdots \\ (\mathbf{x}_N - \bar{\mathbf{x}})^\top \mathbf{U}_k \end{bmatrix} = \mathbf{H} \mathbf{X} \mathbf{U}_k \in \mathbb{R}^{N \times k}, \quad \text{where} \quad \mathbf{H} = \mathbf{I} - \frac{1}{N} \mathbf{1}_N \mathbf{1}_N^\top \in \mathbb{R}^{N \times N}.$$

Principal Coordinate Analysis

We consider the case of $p \ge N$ and define

$$\mathbf{T} = \frac{1}{N-1} \mathbf{H} \mathbf{X} \mathbf{X}^{\top} \mathbf{H} \in \mathbb{R}^{N \times N}$$

with spectral decomposition

$$T = V\Gamma V^{\top},$$

where $\mathbf{V} \in \mathbb{R}^{N \times N}$ is orthogonal and $\mathbf{\Gamma} \in \mathbb{R}^{N \times N}$ is diagonal.

The matrix $\mathbf{Y} \in \mathbb{R}^{N \times k}$ can be written as

$$\mathbf{Y} = \mathbf{V}_k \mathbf{\Gamma}_k^{1/2} \in \mathbb{R}^{N \times k}.$$

- 2 Principal Components Analysis
- 3 Principal Coordinate Analysis
- 4 Kernel Principal Component Analysis

We map the sample $\mathbf{x}_{\alpha} \in \mathcal{X} \subseteq \mathbb{R}^p$ to the feature space $\mathcal{H} \subseteq \mathbb{R}^d$, that is

$$\phi: \mathcal{X} \to \mathcal{H}$$
,

and define the corresponding kernel function (inner product)

$$K(\mathbf{x}, \mathbf{y}) \triangleq \phi(\mathbf{x})^{\top} \phi(\mathbf{y}).$$

The matrix

$$\mathbf{T} = \frac{1}{N-1} \mathbf{H} \mathbf{X} \mathbf{X}^{\top} \mathbf{H} \in \mathbb{R}^{N \times N}$$

contains

$$\mathbf{H}\mathbf{X}\mathbf{X}^{\top}\mathbf{H} = \mathbf{H}\begin{bmatrix} \mathbf{x}_{1}^{\top}\mathbf{x}_{1} & \mathbf{x}_{1}^{\top}\mathbf{x}_{2} & \dots & \mathbf{x}_{1}^{\top}\mathbf{x}_{N} \\ \vdots & \vdots & \ddots & \vdots \\ \mathbf{x}_{N}^{\top}\mathbf{x}_{1} & \mathbf{x}_{N}^{\top}\mathbf{x}_{2} & \dots & \mathbf{x}_{N}^{\top}\mathbf{x}_{N} \end{bmatrix} \mathbf{H} \in \mathbb{R}^{N \times N}.$$

We replace the inner product $\mathbf{x}_i^{\top} \mathbf{x}_j$ with

$$K(\mathbf{x}_i, \mathbf{x}_j) \triangleq \phi(\mathbf{x}_i)^{\top} \phi(\mathbf{y}_j).$$

We replace $\mathbf{X}\mathbf{X}^{\top} \in \mathbb{R}^{N \times N}$ with the kernel matrix

$$\mathbf{K} = \begin{bmatrix} K(\mathbf{x}_1, \mathbf{x}_1) & K(\mathbf{x}_1, \mathbf{x}_2) & \dots & K(\mathbf{x}_1, \mathbf{x}_N) \\ \vdots & \vdots & \ddots & \vdots \\ K(\mathbf{x}_N, \mathbf{x}_1) & K(\mathbf{x}_N, \mathbf{x}_2) & \dots & K(\mathbf{x}_N, \mathbf{x}_N) \end{bmatrix} \in \mathbb{R}^{N \times N}$$

and replace $\mathbf{T} \in \mathbb{R}^{N \times N}$ with

$$T_K = \frac{1}{N-1}HKH.$$

The kernel PCA is achieved by spectral decomposition on T_K .

We replace $\mathbf{X}\mathbf{X}^{\top} \in \mathbb{R}^{N \times N}$ with the kernel matrix

$$\mathbf{K} = \begin{bmatrix} K(\mathbf{x}_1, \mathbf{x}_1) & K(\mathbf{x}_1, \mathbf{x}_2) & \dots & K(\mathbf{x}_1, \mathbf{x}_N) \\ \vdots & \vdots & \ddots & \vdots \\ K(\mathbf{x}_N, \mathbf{x}_1) & K(\mathbf{x}_N, \mathbf{x}_2) & \dots & K(\mathbf{x}_N, \mathbf{x}_N) \end{bmatrix} \in \mathbb{R}^{N \times N}$$

and replace $\mathbf{T} \in \mathbb{R}^{N \times N}$ with

$$T_K = \frac{1}{N-1}HKH.$$

The kernel PCA is achieved by spectral decomposition on T_K .

Examples of kernel functions:

1 We define the polynomial kernel as

$$K(\mathbf{x},\mathbf{y}) = (\mathbf{x}^{\top}\mathbf{y} + c)^d$$

for some $c \in \mathbb{R}$ and $d \in \mathbb{N}$.

2 We define the Gaussian kernel (radial basis function kernel) as

$$\mathcal{K}(\mathbf{x}, \mathbf{y}) = \exp\left(-rac{\|\mathbf{x} - \mathbf{y}\|_2^2}{2\sigma^2}
ight).$$
