The Wishart Distribution

The Likelihood Ratio Criterion

The likelihood ratio criterion:

- Let $L(\mathbf{x}, \theta)$ be the likelihood function of the observation \mathbf{x} and the parameter vector $\theta \in \Omega$.
- ② Let a null hypothesis be defined by a proper subset ω of Ω . The likelihood ratio criterion is

$$\lambda(\mathbf{x}) = \frac{\sup_{\boldsymbol{\theta} \in \omega} L(\mathbf{x}, \boldsymbol{\theta})}{\sup_{\boldsymbol{\theta} \in \Omega} L(\mathbf{x}, \boldsymbol{\theta})}.$$

③ The likelihood ratio test is the procedure of rejecting the null hypothesis when $\lambda(\mathbf{x})$ is less than a predetermined constant.

Test $\rho = \rho_0$ by the Likelihood Ratio Criterion

We consider the likelihood ratio test of the hypothesis that $\rho = \rho_0$ based on a sample $\mathbf{x}_1, \dots, \mathbf{x}_N$ from

$$\mathcal{N}_2\left(\begin{bmatrix}\mu_1\\\mu_2\end{bmatrix},\begin{bmatrix}\sigma_1^2&\sigma_1\sigma_2\rho\\\sigma_1\sigma_2\rho&\sigma_2^2\end{bmatrix}\right).$$

Define the set

$$\Omega = \left\{ (\mu_1, \mu_2, \sigma_1, \sigma_2, \rho) : \boldsymbol{\mu} \in \mathbb{R}^2, \sigma_1 > 0, \sigma_2 > 0, \boldsymbol{\Sigma} \succ \boldsymbol{0} \right\}$$

and its subset

$$\boldsymbol{\omega} = \big\{ \big(\mu_1, \mu_2, \sigma_1, \sigma_2, \rho\big) : \boldsymbol{\mu} \in \mathbb{R}^2, \sigma_1 > 0, \sigma_2 > 0, \boldsymbol{\Sigma} \succ \boldsymbol{0}, \rho = \rho_0 \big\}.$$

We also follow the notation

$$r = \frac{a_{12}}{\sqrt{a_{11}}\sqrt{a_{22}}}, \quad \mathbf{A} = \sum_{\alpha=1}^N (\mathbf{x}_\alpha - \bar{\mathbf{x}})(\mathbf{x}_\alpha - \bar{\mathbf{x}})^\top \quad \text{and} \quad \bar{\mathbf{x}} = \frac{1}{N}\sum_{\alpha=1}^N \mathbf{x}_\alpha.$$

Test $\rho = \rho_0$ by the Likelihood Ratio Criterion

The likelihood ratio criterion is

$$\frac{\sup_{\boldsymbol{\theta} \in \omega} L(\mathbf{x}, \boldsymbol{\theta})}{\sup_{\boldsymbol{\theta} \in \Omega} L(\mathbf{x}, \boldsymbol{\theta})} = \left(\frac{(1 - \rho_0^2)(1 - r^2)}{(1 - \rho_0 r)^2}\right)^{\frac{N}{2}}.$$

The likelihood ratio test is

$$\frac{(1-\rho_0^2)(1-r^2)}{(1-\rho_0r)^2} \le c$$

where c is chosen by the prescribed significance level.

The Maximum Likelihood Estimators

Let $\phi: \mathcal{S}
ightarrow \mathcal{S}^*$ (may be not one-to-one) and

$$\phi^{-1}(oldsymbol{ heta}^*) = \{oldsymbol{ heta}: oldsymbol{ heta}^* = \phi(oldsymbol{ heta})\}.$$

and define (the induced likelihood function)

$$g(\theta^*) = \sup\{f(\theta) : \theta^* = \phi(\theta)\}.$$

If $\theta = \hat{\theta}$ maximize $f(\theta)$, then $\theta^* = \phi(\hat{\theta})$ also maximize $g(\theta^*)$.

Test $\rho = \rho_0$ by the Likelihood Ratio Criterion

The critical region can be written equivalently as

$$(\rho_0^2 c - \rho_0^2 + 1)r^2 - 2\rho_0 cr + c - 1 + \rho_0^2 \ge 0,$$

that is,

$$r > rac{
ho_0 c + (1 -
ho_0^2) \sqrt{1 - c}}{
ho_0^2 c -
ho_0^2 + 1}$$
 and $r < rac{
ho_0 c - (1 -
ho_0^2) \sqrt{1 - c}}{
ho_0^2 c -
ho_0^2 + 1}.$

Thus the likelihood ratio test of H: $\rho = \rho_0$ against alternatives $\rho \neq \rho_0$ has a rejection region of the form $r > r_1$ and $r < r_2$.

Outline

The Likelihood Ratio Criterion

2 The Asymptotic Distribution of Sample Correlation

The Wishart Distribution

The Asymptotic Distribution of Sample Correlation

For a sample $\mathbf{x}_1, \dots, \mathbf{x}_N$ from a normal distribution $\mathcal{N}(\mu, \mathbf{\Sigma})$, we are interested in the asymptotic behavior of sample correlation coefficient

$$r(n) = \frac{a_{ij}(n)}{\sqrt{a_{ii}(n)}\sqrt{a_{jj}(n)}}$$

where n = N - 1.

$$a_{ij}(n) = \sum_{\alpha=1}^{N} (x_{i\alpha} - \bar{x}_i)(x_{j\alpha} - \bar{x}_j) = \sum_{\alpha=1}^{n} \begin{bmatrix} z_{i\alpha} \\ z_{j\alpha} \end{bmatrix} \begin{bmatrix} z_{i\alpha} & z_{j\alpha} \end{bmatrix}$$

with

$$\begin{bmatrix} z_{i\alpha} \\ z_{j\alpha} \end{bmatrix} \sim \mathcal{N} \left(\begin{bmatrix} 0 \\ 0 \end{bmatrix}, \begin{bmatrix} \sigma_{ii} & \sigma_{ij} \\ \sigma_{ji} & \sigma_{jj} \end{bmatrix} \right) \quad \text{and} \quad \bar{x}_i = \frac{1}{N} \sum_{\alpha=1}^N x_{i\alpha}.$$

The Asymptotic Distribution of Sample Correlation

Theorem

Let

$$\mathbf{A}(n) = \sum_{\alpha=1}^{N} (\mathbf{x}_{\alpha} - \bar{\mathbf{x}}_{N}) (\mathbf{x}_{\alpha} - \bar{\mathbf{x}}_{N})^{\top},$$

where $\mathbf{x}_1, \dots, \mathbf{x}_N$ are independently distributed according to $\mathcal{N}_p(\mu, \mathbf{\Sigma})$ and n = N - 1. Then the limiting distribution of

$$\mathbf{B}(n) = \frac{1}{\sqrt{n}} (\mathbf{A}(n) - n\mathbf{\Sigma})$$

is normal with mean $oldsymbol{0}$ and covariance of the entries of $oldsymbol{\mathsf{B}}(n)$ is

$$\mathbb{E}\big[b_{ij}(n)b_{kl}(n)\big] = \sigma_{ik}\sigma_{jl} + \sigma_{il}\sigma_{jk}.$$

The Asymptotic Distribution of Sample Correlation

We achieve

$$\lim_{n\to\infty}\frac{\sqrt{n}(r(n)-\rho)}{1-\rho^2}\sim\mathcal{N}(0,1).$$

by applying the following theorem.

Theorem (Serfling (1980), Section 3.3)

Let $\{\mathbf{u}(n)\}$ be a sequence of m-component random vectors and \mathbf{b} a fixed vector such that

$$\lim_{n\to\infty}\sqrt{n}(\mathbf{u}(n)-\mathbf{b})\sim\mathcal{N}(\mathbf{0},\mathbf{T}).$$

Let $\mathbf{f}(\mathbf{u})$ be a vector-valued function of \mathbf{u} such that each component $f_j(\mathbf{u})$ has a nonzero differential at $\mathbf{u} = \mathbf{b}$, and define $\Phi_{\mathbf{b}}$ with its (i,j)-th component being

$$\frac{\partial f_j(\mathbf{u})}{\partial u_i}\Big|_{\mathbf{u}=\mathbf{b}}.$$

Then $\sqrt{n}(\mathbf{f}(\mathbf{u}(n)) - f(\mathbf{b}))$ has the limiting distribution $\mathcal{N}(\mathbf{0}, \mathbf{\Phi}_{\mathbf{b}}^{\top} \mathbf{T} \mathbf{\Phi}_{\mathbf{b}})$.

Outline

The Likelihood Ratio Criterion

The Asymptotic Distribution of Sample Correlation

The Wishart Distribution

John Wishart

John Wishart (November 28th, 1898 – July 14th, 1956)

The Wishart Distribution

We consider the distribution of

$$\mathbf{A} = \sum_{lpha=1}^{N} (\mathbf{x}_{lpha} - ar{\mathbf{x}}) (\mathbf{x}_{lpha} - ar{\mathbf{x}})^{ op},$$

where $\mathbf{x}_1, \dots, \mathbf{x}_N$ are independent, each with the distribution $\mathcal{N}_p(\mu, \mathbf{\Sigma})$ and N > p.

The distribution of $\bf A$ is often called Wishart distribution with n degrees of freedom and scale parameter $\bf \Sigma$, written as

$$\mathbf{A} \sim \mathcal{W}_p(\mathbf{\Sigma}, n)$$
 where $n = N - 1 \ge p$.

The Wishart Distribution

We can write

$$\mathbf{A} = \sum_{lpha=1}^n \mathbf{z}_lpha^ op \mathbf{z}_lpha,$$

where $\mathbf{z}_1, \dots, \mathbf{z}_n$ are independent, each with the distribution $\mathcal{N}_p(\mathbf{0}, \mathbf{\Sigma})$ and N = n - 1.

For p = 1, we have

$$a \sim \mathcal{W}_1(\sigma^2, n)$$
 and $\frac{a}{\sigma^2} \sim \chi^2(n)$.

Properties of Wishart Distribution

Theorem

Let $\mathbf{A} \sim \mathcal{W}_p(\mathbf{\Sigma}, n)$ and $\mathbf{C} \in \mathbb{R}^{q \times p}$, then

$$\mathsf{CAC}^{\top} \sim \mathcal{W}_p(\mathsf{C\SigmaC}^{\top}, n).$$

For any $\mathbf{t} \in \mathbb{R}^p$, we have

$$\mathbf{t}^{\top}\mathbf{A}\mathbf{t} \sim \mathcal{W}_1(\mathbf{t}^{\top}\mathbf{\Sigma}\mathbf{t}, \textit{n}) \qquad \text{and} \qquad \frac{\mathbf{t}^{\top}\mathbf{A}\mathbf{t}}{\mathbf{t}^{\top}\mathbf{\Sigma}\mathbf{t}} \sim \chi^2(\textit{n}).$$

Properties of Wishart Distribution

Theorem.

If $\mathbf{A}_1, \dots, \mathbf{A}_k$ are independently distributed with $\mathbf{A}_i \sim \mathcal{W}(\mathbf{\Sigma}, n_i)$ for $i = 1, \dots, k$, then

$$\mathbf{A} = \sum_{i=1}^k \mathbf{A}_i \sim \mathcal{W}\left(\mathbf{\Sigma}, \sum_{i=1}^k n_i\right).$$

Properties of Wishart Distribution

Theorem

Let

$$\mathbf{Z} = \begin{bmatrix} \mathbf{z}_1^{\top} \\ \vdots \\ \mathbf{z}_n^{\top} \end{bmatrix} \in \mathbb{R}^{n \times p},$$

where $\mathbf{z}_1, \dots, \mathbf{z}_n$ are independent, each with the distribution

$$\mathcal{N}_{p}(\mathbf{0}, \mathbf{\Sigma}).$$

For projection matrix $\mathbf{Q} \in \mathbb{R}^{n \times n}$ with rank-r, we have

$$\mathbf{Z}^{\top}\mathbf{Q}\mathbf{Z} \sim \mathcal{W}_{p}(\mathbf{\Sigma}, r).$$

The Density of Wishart Distribution

The density of $\mathbf{A} \sim \mathcal{W}_p(\mathbf{\Sigma}, n)$ is

$$\frac{\left(\det(\boldsymbol{\mathsf{A}})\right)^{\frac{n-\rho-1}{2}}\exp\left(-\frac{1}{2}\mathrm{tr}\left(\boldsymbol{\Sigma}^{-1}\boldsymbol{\mathsf{A}}\right)\right)}{2^{\frac{n\rho}{2}}\pi^{\frac{\rho(\rho-1)}{4}}\left(\det(\boldsymbol{\Sigma})\right)^{\frac{n}{2}}\prod_{i=1}^{\rho}\Gamma\left(\frac{1}{2}(n+1-i)\right)}.$$

for positive definite **A** and 0 elsewhere.

Quiz 1

Let
$$\mathbf{A} \in \mathbb{R}^{p \times p}$$
 and define $\mathbf{F} : \mathbb{R}^{p \times q} \to \mathbb{R}^{p \times q}$ as

$$F(X) = AX.$$

What is the determinant of Jacobian of F(X)?

Quiz 1.5

Let
$$\mathbf{A}\in\mathbb{R}^{p imes p}, \mathbf{B}\in\mathbb{R}^{q imes q}$$
 and define $\mathbf{F}:\mathbb{R}^{p imes q} o\mathbb{R}^{p imes q}$ as
$$\mathbf{F}(\mathbf{X})=\mathbf{A}\mathbf{X}\mathbf{B}.$$

What is the determinant of Jacobian of F(X)?

Quiz 2

Let $\mathbf{A} \in \mathbb{R}^{p \times p}$ be non-singular and define $\mathbf{F} : \mathbb{S}^p \to \mathbb{R}^{p \times p}$ as

$$F(X) = AXA^{\top},$$

where
$$\mathbb{S}^p = \{ \mathbf{X} \in \mathbb{R}^{p \times p} : \mathbf{X} = \mathbf{X}^\top \}.$$

What is the determinant of Jacobian of F(X)?
